

TITAN SYSTEM – COMPLETE ARCHITECTURE & MASTER IMPLEMENTATION SPEC

COMPLETE MODULE LIST

- 1. Titan
- 2. Titan Core
- 3. Titan Master
- 4. Titan Monitor
- 5. Titanis (Sales Engine)
- 6. Titanix (Execution Engine)
- 7. Client Hunter Module
- 8. Scraper Module
- 9. Proxy & Rotation Module
- 10. Online Data Sources Module
- 11. Validator Module
- 12. Lead Scoring Module
- 13. CRM Module
- 14. Outreach Module
- 15. Follow-up Automation Module
- 16. Deal & Offer Module
- 17. Package & Pricing Module
- 18. Contract Automation Module
- 19. Digital Signature Module
- 20. Billing & Payment Module
- 21. Invoice Module
- 22. Subscription Module
- 23. Alert System Module
- 24. Error Handling Module
- 25. Logging Module
- 26. Security Module
- 27. Access Control Module
- 28. Audit Log Module
- 29. Phase Launch Module
- 30. Resource Management Module
- 31. Scaling Module
- 32. Load Balancer Module
- 33. Database Core
- 34. Backup & Recovery Module
- 35. Analytics Module
- 36. KPI Module
- 37. AI Learning & Memory Module
- 38. Titan Score Module
- 39. Recommendation Module
- 40. Compliance Module
- 41. GDPR Module
- 42. Public Website
- 43. Client Dashboard
- 44. Admin Dashboard
- 45. API Gateway

- 46. Integration Hub
- 47. Notification Module
- 48. Email System
- 49. Template Engine
- 50. System Updater Module

MASTER IMPLEMENTATION INSTRUCTION FOR CURSOR

1. Analyze existing codebase completely.
2. Refactor architecture to match the module structure defined in this document.
3. Ensure strict modular isolation – no direct module-to-module dependency.
4. Titan Core must orchestrate all modules.
5. Phase Launch Module must control activation of modules by phase.
6. Standardize folder structure, naming conventions, logging and error handling.
7. Remove hardcoded values and move configuration to environment variables.
8. Implement unit tests for every module.
9. Implement integration tests between core systems.
10. Execute full system simulation (lead → deal → contract → payment).
11. If any test fails, migration is prohibited.
12. After all tests pass:
 - Create snapshot of test-main.
 - Backup master-main.
 - Merge test-main into master-main.
 - Verify structure integrity.
 - Perform system health check.
13. Only fully tested code is allowed into master-main.
14. System must support environment separation: development, test, production.
15. Database migration scripts and rollback strategy must exist before deployment.
