Custom Software — Handoff Documentation

Software starter kit — Client

Prepared for: Client

Deliverable: Software starter kit

Date: 06/10/2026

Project overview

Productized starter software: Node API + SPA scaffold with README, .env.example, smoke tests, and handoff PDF (run/deploy) — not a finished custom product or unlimited build hours. for Client (Healthcare): scoped digital delivery with live site, documentation, and invoice trail.

- Client: Client
- Industry context: Healthcare
- Project: Software starter kit
- Stack baseline: Node.js API + static SPA shell (productized starter)
- Scope: starter deliverable complete — not unlimited custom build hours

Delivered artifacts

1. Source tree at: /app/data/product-factory/client_order/co-ab4462c3993408b5
2. README.md — local run + deploy steps
3. .env.example — copy to .env before start (no secrets committed)
4. tests/enhanced.test.js — smoke tests; fulfillment records testsPassed from real run
5. Handoff PDF + markdown bundle for operators

Acceptance: testsPassed=true from factory test run; build status completed.

How to run the scaffold

1. cd /app/data/product-factory/client_order/co-ab4462c3993408b5
2. cp .env.example .env (set JWT_SECRET before shared deploys)
3. npm test
4. npm start
5. Open http://localhost:4100 — curl /health and /api/v1/meta

Day-0 checklist: & .env filled & npm test green & /health 200 & SPA loads

Architecture

- API routes under src/routes/api.js
- Schema / migrations under src/db/schema.sql
- Config via env (.env.example) — never hardcode credentials
- Static client shell in public/; CORS via CORS_ORIGIN in prod
- Health endpoint /health for uptime probes; structured JSON errors

Extend carefully: add feature flags for risky paths; keep healthz for uptime probes.

Architecture acceptance: & route map & env list & no secrets in git & healthz green

Deployment runbook

1. Copy tree to host or containerize (Node 20+)
2. Set PORT, DATABASE_URL, JWT_SECRET, CORS_ORIGIN, NODE_ENV=production from .env.example
3. Apply src/db/schema.sql if using Postgres

4. npm test && npm start under systemd/PM2/Docker
5. TLS terminator in front; confirm /health and backup job
6. Record deploy timestamp and rollback tag

Rollback: previous image/tag + DB migration down plan. Milestone: first prod deploy with monitored error budget.

Day 0 checklist: & env set & migrate & healthz & TLS & backup job scheduled

Test plan & milestones

Checklist:

- & Unit/smoke tests green in CI/local (npm test)
- & Auth happy/fail paths when you add auth
- & Critical business flow E2E
- & Backup/restore note for Day 0
- & Week 2: performance snapshot
- & Day 30: change-request backlog triage

Milestones: M1 code delivery · M2 deploy · M3 acceptance sign-off.

Support & change control

Prepared for Client. Route change requests via dashboard support with acceptance criteria and KPI impact.

- SLA: acknowledge within 1 business day unless retainer says otherwise
- Security issues: escalate immediately; rotate secrets if needed
- Do not ship with placeholder credentials from .env.example
