

Omni Group

Custom Integration Guide

Client — Admin Support

Prepared for: Client
Deliverable: Custom integration
Date: 06/10/2026

API overview

Client (Admin Support) integrations should treat Omni REST surfaces as the system of record for payments, deliverables, and portal identity.

Scope honesty: this package is a documented map + integration-config.json — tools are NOT already connected until your developer adds API keys.

- Base path: /api/v1 (JWT bearer)
- Idempotency: send Idempotency-Key on payment-confirm and webhook retries
- Vertical modules in scope: automation, crm, tasks, notifications, client-hunter
- Industry domain tokens: virtual assistant, inbox triage, calendar management, SOP checklist
- Error contract: JSON { error, code, requestId } — log requestId for support
- Download integration-config.json for envMap, webhookEndpoints, retryPolicy, and onboardingChecklist

Sequence (happy path): Auth !' create/update CRM contact !' attach payment reference !' await payment.completed webhook !' unlock deliverable artifacts.

Authentication

1. Issue user JWT via login; store refresh token server-side only
2. Scope admin vs client roles; never embed admin tokens in frontends
3. Rotate API keys quarterly; revoke on staff offboarding (Day 0 checklist)
4. Prefer short-lived access tokens ("d1h) with refresh rotation

Acceptance: login, refresh, and forbidden-role probes documented with timestamps.

Webhooks

Subscribe at minimum to: payment.completed, deliverable.ready, support.ticket.created.

1. Verify HMAC signature header before mutating CRM
2. Return 2xx quickly; process async if heavy
3. Apply retryPolicy from integration-config.json (exponential backoff + dead-letter)
4. Map payment_id !" external invoice id in a durable table

Admin Support integration notes:

- Tag tasks with client + source channel
- Calendar webhooks for conflict detection
- Shared vault tokens scoped per client workspace

Industry note: tag webhook payloads with source=admin_support for reporting (never embed sensitive virtual assistant payloads).

Email, notifications & payments

- Transactional mail: payment received, deliverable ready, password reset

- Admin notify on failed webhook or stuck fulfillment job
- Manual bank-transfer path remains first-class; Stripe optional
- Never invent merchant IDs — leave placeholders until credentials exist (see envMap)

Payment confirm checklist:

- & Reference code unique
- & Amount/currency match quote
- & Fulfillment job enqueued
- & Client can download artifacts

Onboarding when you add API keys

Execute this checklist with integration-config.json open (also delivered as integration-onboarding-checklist.md):

1. Store webhookSecret as INTEGRATION_WEBHOOK_SECRET in your vault — never commit it
2. Register webhookEndpoints in Stripe/provider dashboards
3. Fill only the envMap keys you need (Stripe, email, AI) — unused stay blank
4. Implement HMAC verify + retryPolicy; send Idempotency-Key on retries
5. Sandbox E2E: Auth !' CRM !' payment !' artifact unlock using sampleEvents
6. Production cutover: rotate secrets, swap live keys, monitor 24h

Admin Support compliance before cutover:

- & PII access limited to assigned VA roles
- & Client credential vault policy (no shared passwords in chat)
- & Outbound email send-as authorization documented

Done when: staging E2E green and live keys are not mixed with sandbox.

Testing & go-live checklist

Quality gates:

- Research complete (TAM + competition in research_data)
- Artifacts generated (module, landing, workflow, outreach, quality pack)
- Dynamic pricing quote valid for verticalSlug
- CRM pipeline and lead source defined
- Outreach draft reviewed before send (domain warmup)
- Smoke test / owner sign-off before client delivery

Go-live milestones:

1. Sandbox webhook echo verified
2. Staging end-to-end purchase !' artifact
3. Production keys rotated + secrets scan clean
4. Rollback: disable webhook consumer flag
5. Inbox triage live
6. Calendar ownership mapped
7. SOP pack signed

Day-1 ops: monitor error rate, p95 webhook latency, failed fulfillment count.

Security & support runbook

- Rotate webhook secrets after any suspected leak
- Rate-limit public endpoints; CAPTCHA on lead forms if abuse appears
- Escalation: dashboard support !' on-call email !' incident channel

- ROI hook for Client: fewer manual reconciliations after webhook automation
- Inbox backlog without triage SLA
- Calendar double-books across timezones

Acceptance checklist:

- & Auth probes pass
- & Webhook signature verified in staging
- & Payment !' deliverable E2E green
- & Runbook contacts confirmed
- & Admin Support integration notes reviewed
